Ge'neral Practi'tioner. *Med.* A term applied to those practitioners (forming more than nine-tenths of the profession) in England and Wales, who do not profess to advise as *pure* Physicians, or to act as *pure* Surgeons, but who are legally, as well as by the completeness of their education, qualified to perform, and do perform in their daily vocation the whole duties of both, with those of the Obstetrician in addition. They are also called Surgeon-Apothecaries, because, for the most part, they are Members of a College of Surgeons, besides being Licentiates of the Apothecaries' Company. The mere Apothecary, however, in virtue of his license, exercises all the duties of the *purest* Physician and Surgeon as well as of the Accoucheur and the Apothecary, as if he possessed every qualification. In Scotland, these striking incongruities, happily, have no existence; every regularly qualified practitioner there, Physician or Surgeon, or both (there are no Apothecaries in the English or Irish sense of the term) enjoys a perfect professional equality, and can rise to official or social importance, by his own merits alone. In Ireland, the grades are even more distinctly separated, and probably the classes are about as pure as the so styled Physicians and Surgeons of England. See *Pure*.

The most recent opinion is, that the uterus during impregnation opens a little, draws in the semen by aspiration (some have imagined merely the *Aura seminalis*, or seminal vapour; but this, by later experiments, has been disproved, there being no fecundating property in the vapour) and directs it to the *Ovarium* by means of the Fallopian tube, the fimbriated extremity of which closely embraces that organ: the contact of the semen determines the rupture of one of the vesicles of the ovary, and the fluid proceeding from it, or the vesicle itself, gradually passes along the Fallopian tube into the uterus, where the new being is to be developed. *Gĕnĕrātio, ōnis*, f. See *Genitura*. Fr. anal. *génération*, f. Germ. syn. *Zeugung*, f.

Genera'tion, Equi'vocal. *Physiol.* Term expressive of a mode of generation, believed in by the ancients, who supposed that a plastic energy existed in the universe, under the influence of which, matter in certain circumstances could become organised, and new living beings be thus spontaneously produced; as when minute animals are apparently formed from putrefaction, and in infusions of animal or vegetable substances; also called *Epigenesis*.

Hydro'pathy. (*Ὕδωρ*, water; *πάθος*, disease.) Water-disease; a term applied to a system of treating inflammatory, and almost all other complaints, by the plentiful use, internal and external, of cold water. This water practice was strongly urged on the attention of the profession and the public by certain medical men in the end of the last, and beginning of this century; but, from numerous instances of fatal result, it fell into disrepute. It was popularly and quackishly employed two centuries and a half ago, among the superstitious of those days in Scotland, and similarly about a century later in certain districts of England. Of late years, it was revived by Vincent Priessnitz, an illiterate peasant of Silesia, who having broken his ribs, mended them by its means, as he conceived, in the marvellously short space of one year. The term simply means water disease, a species of malady which the system is very likely to promote; but by its professors it is rendered water-cure, a rather free translation; also called by the more classical terms *Hydrotherapia*, and *Hydriasis. -Ida. *Zoöl.* A terminal erroneously substituted by some authors for *-idæ*, which see.

-Idæ. *Zoöl.* A terminal which frequently occurs in compound names of the Orders, Sections, Genera, or Species of animals, denoting a family or group exhibiting some points of likeness in form, appearance, or habits, to the type, usually an animal, (but sometimes an inanimate object,) indicated by the word to which the terminal is joined, as *Leporidæ*, the family of the *Lepus*, or hare, etc. The terminal *-adæ*, is used similarly to this one in a few compound words of the same character as those into which it (*-idæ*) enters. Another terminal, *-ida*, has been erroneously substituted by some authors, for *-idæ*, of which, however, it is evidently only a corruption.

NOTE.—Equal uncertainty to that referred to under the terminal *-Ides*, has hitherto attended the grammatical character and etymology of compound terms ending in *-adæ* and *-Idæ*. They are entirely of modern invention, receiving no light from lexicons or dictionaries of any kind. A brief explanation therefore of the grounds on which they are characterised in this work seems necessary. Both sets of compounds, *-adæ* and *-idæ*, are meant to be imitations of the classical patronymic noun, each term signifying a family or group of animals connected with each other by some general points of similarity in their form, appearance, or habits.

-Ide. *Chem.* A terminal affixed to oxygen, chlorine, fluorine, and iodine when combined with each other, or with simple combustibles, or metals, in proportions not forming an acid; as ox-*ide* of chlorine, chlor-*ide* of sulphur, iod-*ide* of iron, etc. *Med., Pathol.* A terminal entering into the composition of certain names, or terms applied as names of diseases borrowed from the French, as *Cancroide, Keloide*, etc. Thus employed it is to be regarded in all respects the same as *-ides*, the absence of the final *s* being attributable solely to the peculiarity of spelling in that language.

-Idēs. As if *Eidēs.* (Εἶδος, likeness, or resemblance; from εἴδω, to see—passive voice, to *seem.*) *Anat., Chem., Nat. Hist.* A terminal denoting likeness or resemblance to an object indicated by the word to which it is joined, as *Cricoīdēs, Alkaloīdēs,* etc. From this terminal being very generally preceded by the letter *o,* as in the examples just given, and from the sound accorded to the corresponding syllable in their English synonymes Cricoid, Alkaloid, etc., the *o* and *i* thus associated are apt to receive a diphthongal pronunciation which has no existence in the Latin language. The *o* is no integral part of the penultimate syllable, but is merely supplied, or substituted at the end of the first or substantive portion of these and of numerous other differently compounded terms, as a convenient link, or means of connection between it and the terminal. The long accented *ī,* in *īdēs* is the proper conversion into Latin of the Greek diphthong εἰ in εἶδος. See *Diss. div.* i. *s.* i. Fr. anal. *-ide.*

-Idēus. (Terminal *-īdēs.*) *Anat.* A terminal entering into the formation of certain compound terms having the usual adjective quality *of or belonging to,* and which are applied to muscles that are connected with bones, or cartilages designated by terms ending in *-īdēs;* as *Arytænoideus* (*musculus* being understood) the Arytenoidean muscle which fills the interval between the *Arytænoides* (*cartilagines,*) or Arytenoid cartilages. *Nat. Hist.* Its compounds have here the ordinary adjective application to objects or animals having resemblance to a particular type indicated by the word to which it is added. But thus employed they can only be regarded as erroneous substitutions for the proper terms in *-īdēs.* See *Diss. div.* i. *s.* ii. Fr. anal. *-ide.*

-Is'mus. (From *-ίζω*, a termination of many Greek verbs.) *Pathol., Physiol.* A terminal of frequent occurrence in Greek derivative terms adopted into the Latin phraseology of the medical profession, as *trismus*, *erethismus*, etc. It has also been applied to designate as *diseases* certain spasmodic affections of muscles, as *Strabismus*, *Laryngismus*, etc. It has now, however, been proposed by Dr. M. Hall, that this terminal should be used to designate only a *symptom* of a purely nervous character, and so opposite to *-itis*, which is vascular. This rule for its employment is at once etymologically just; its observance will assist materially in explaining terms compounded of it, and most aptly characterise affections to which these may be applied. The termination *-ism*, or *-ismus*, is frequently employed, by imitation, to denote a certain kind of action, without there being any word in *-ίζω* from which to immediately derive the term.

Lock Hospital. A name very generally adopted in Great Britain to characterise a charitable institution for the treatment of venereal diseases, and originating as follows. In the 15th century there existed a number of lazar-houses in and around London, "at Knightsbridge, Hammersmith, Highgate, Kingsland, the *Lock* outside St. George's gate, and at Mile End." In 1452, Ralph Holland, merchant tailor, by his will bequeathed twenty shillings to the *Lock* lazar-house, thus, "*Item, lego leprosis de Lokis extra Barram Sti. Georgii* 20*s.*" according to Weatherhead. This same Lock lazar-house afterwards became an hospital for syphilitic patients; hence it, and, in imitation, many similar institutions throughout the kingdom came each to be designated, simply, a Lock hospital. The origin of the word Lock has been differently explained, being said to be from *Loke,* a house for lepers.—Acton on *Vener. Dis. 2d. Ed. Introd. p.* 16,—and from *Loque,* a rag, or tatter, such being much employed by the patients, or because of the poverty of the applicants for its benefits. *Lond. Journ. of Med. vol.* iii. *p.* 185.

NOTE.—These etymologies of the term *Lock* are by no means satisfactory. *Loke* I cannot trace beyond the passage in the will quoted by Weatherhead, Mr. Acton's translation of which seems arbitrary, and his application of it not well founded, for there were six leper or lazar-houses, each of which therefore must have been as much a *Lock-lazarhouse* as that outside St. George's gate; besides the title itself is absurdly redundant. *Loque,* again, an obsolete French word for rag or tatter, applies no more to one than to another of the six lazar-houses and to every surgical hospital, and so could form no distinctive epithet of that indicated. I would suggest the Saxon *Loc,* a lock, or the French *Loquet,* the latch of a door, referring to St. George's gate, bar (barbarously rendered *barram*), or other means by which that entrance to the city was secured, and outside of which stood the lazarhouse, named from that circumstance *Lock,* as at least a more consistent etymon.

Lodge. Lodge-Doc'tor. } *Med.* Epithets applied popu-
Lodge-Sur'geon. } larly to certain young and other practitioners, indicating a position often much sought after by such, as a means of getting practice. It involves a compact by which its holder agrees to attend the members of a lodge, while sick, for *two shillings and sixpence* a-year each; a rate of remuneration for the most important professional services, night or day, which no brother- (the members are so styled) tailor or shoemaker would accept for the exercise of *his* calling, under the most limited range of casualties to which garments or shoes are liable. Practically the compact is unsatisfactory to both parties, for if the lodge-doctor acts conscientiously he will be a loser; if he does not, then the sick will be unfairly treated; and experience unequivocally proves that the latter impression prevails, members and their friends, in all cases of serious illness, seeking other help than his, on the matter-of-fact plea that they have had *only* the lodge-doctor. The lodge or club system of medical recompense brings contempt upon the medical man who adopts it, and is an injustice to the profession.
